# Package 'edm1.vector'

# July 12, 2024

Title Set of functions for vector manipulation
<b>Version</b> 2.0.0.0
<b>Description</b> Provides a set of functions to manipulate data directly in vectors according to a lot of custom algorythms.
License GPL (==3)
Encoding UTF-8
<b>Roxygen</b> list(markdown = TRUE)
RoxygenNote 7.3.1

appndr

appndr

# Description

Append to a vector "inpt\_v" a special value "val" n times "mmn". The appending begins at "strt" index.

# Usage

```
appndr(inpt_v, val = NA, hmn, strt = "max")
```

# Arguments

inpt\_v is the input vector
val is the special value

hmn is the number of special value element added

strt is the index from which appending begins, defaults to max which means the end

of "inpt\_v"

better\_split 3

#### **Examples**

```
print(appndr(inpt_v=c(1:3), val="oui", hmn=5))
#[1] "1"    "2"    "3"    "oui" "oui" "oui" "oui" "oui"
print(appndr(inpt_v=c(1:3), val="oui", hmn=5, strt=1))
#[1] "1"    "oui" "oui" "oui" "oui" "oui" "2"    "3"
```

better\_split

better\_split

# Description

Allows to split a string by multiple split, returns a vector and not a list.

# Usage

```
better_split(inpt, split_v = c())
```

#### **Arguments**

```
inpt is the input character
split_v is the vector containing the splits
```

#### **Examples**

```
print(better_split(inpt = "o-u_i", split_v = c("-")))
[1] "o" "u_i"
print(better_split(inpt = "o-u_i", split_v = c("-", "_")))
[1] "o" "u" "i"
```

better\_unique

better\_unique

#### **Description**

Returns the element that are not unique from the input vector

# Usage

```
better_unique(inpt_v, occu = ">-1-")
```

4 closer\_ptrn

#### **Arguments**

inpt\_v occu is the input vector containing the elements

is a parameter that specifies the occurence of the elements that must be returned, defaults to ">-1-" it means that the function will return all the elements that are present more than one time in inpt\_v. The synthax is the following "comparaison\_type-actual\_value-". The comparaison type may be "==" or ">" or "<". Occu can also be a vector containing all the occurence that must have the elements to be returned.

# **Examples**

closer\_ptrn

closer\_ptrn

# Description

Take a vector of patterns as input and output each chosen word with their closest patterns from chosen patterns.

# Usage

```
closer_ptrn(
   inpt_v,
   base_v = c("?", letters),
   excl_v = c(),
   rtn_v = c(),
   sub_excl_v = c(),
   sub_rtn_v = c()
)
```

closer\_ptrn 5

#### **Arguments**

inpt v	is the input vector containing all the patterns
base_v	must contain all the characters that the patterns are succeptible to contain, defaults to c("?", letters). "?" is necessary because it is internally the default value added to each element that does not have a sufficient length compared to the longest pattern in inpt_v. If set to NA, the function will find by itself the elements to be filled with but it may takes an extra time
excl_v	is the vector containing all the patterns from inpt_v to exclude for comparing them to others patterns. If this parameter is filled, so "rtn_v" must be empty.
rtn_v	is the vector containing all the patterns from inpt_v to keep for comparing them to others patterns. If this parameter is filled, so "rtn_v" must be empty.
sub_excl_v	is the vector containing all the patterns from inpt_v to exclude for using them to compare to another pattern. If this parameter is filled, so "sub_rtn_v" must be empty.
sub_rtn_v	is the vector containing all the patterns from inpt_v to retain for using them to compare to another pattern. If this parameter is filled, so "sub_excl_v" must be empty.

```
print(closer_ptrn(inpt_v=c("bonjour", "lpoerc", "nonnour", "bonnour", "nonjour", "aurevoi

```

```
closer_ptrn_adv closer_ptrn_adv
```

# Description

Allow to find how patterns are far or near between each other relatively to a vector containing characters at each index ("base\_v"). The function gets the sum of the indexes of each pattern letter relatively to the characters in base\_v. So each pattern can be compared.

# Usage

```
closer_ptrn_adv(
  inpt_v,
  res = "raw_stat",
  default_val = "?",
  base_v = c(default_val, letters),
  c_word = NA
)
```

#### **Arguments**

inpt_v	is the input vector containing all the patterns to be analyzed
res	is a parameter controling the result. If set to "raw_stat", each word in inpt_v will come with its score (indexes of its letters relatively to base_v). If set to something else, so "c_word" parameter must be filled.
default_val	is the value that will be added to all patterns that do not equal the length of the longest pattern in inpt_v. Those get this value added to make all patterns equal in length so they can be compared, defaults to "?"
base_v	is the vector from which all pattern get its result (letters indexes for each pattern relatively to base_v), defaults to c("default_val", letters). "default_val" is another parameter and letters is all the western alphabetic letters in a vector
c_word	is a pattern from which the nearest to the farest pattern in inpt_v will be compared

#[1] "bonjour" "bonnour" "aurevoir" "nonnour" "mois"

#### **Examples**

"fin"

8 clusterizer\_v

```
print(closer_ptrn_adv(inpt_v=c("aurevoir", "bonnour", "nonnour", "fin", "mois")))
#[[1]]
#[1] 117 107 119 37 64
#
#[[2]]
#[1] "aurevoir" "bonnour" "nonnour" "fin" "mois"
```

clusterizer\_v clusterizer\_v

#### **Description**

Allow to output clusters of elements. Takes as input a vector "inpt\_v" containing a sequence of number. Can also take another vector "w\_v" that has the same size of inpt\_v because its elements are related to it. The way the clusters are made is related to an accuracy value which is "c\_val". It means that if the difference between the values associated to 2 elements is superior to c\_val, these two elements are in distinct clusters. The second element of the outputed list is the begin and end value of each cluster.

# Usage

```
clusterizer_v(inpt_v, w_v = NA, c_val)
```

# **Arguments**

inpt\_v is the vector containing the sequence of numberw\_v is the vector containing the elements related to inpt\_v, defaults to NAc\_val is the accuracy of the clusterization

```
print(clusterizer_v(inpt_v=sample.int(20, 26, replace=TRUE), w_v=NA, c_val=0.9))

```

cutr\_v cutr\_v

# Description

Allow to reduce all the elements in a vector to a defined size of nchar

# Usage

```
cutr_v(inpt_v, untl = "min")
```

# Arguments

untl

inpt\_v is the input vector

is the maximum size of nchar authorized by an element, defaults to "min", it means the shortest element in the list

cut\_v 11

#### **Examples**

```
test_v <- c("oui", "nonon", "ez", "aa", "a", "dsfsdsds")
print(cutr_v(inpt_v=test_v, untl="min"))
#[1] "o" "n" "e" "a" "a" "d"
print(cutr_v(inpt_v=test_v, untl=3))
#[1] "oui" "non" "ez" "aa" "a" "dsf"</pre>
```

cut\_v

v\_to\_datf

#### **Description**

Allow to convert a vector to a dataframe according to a separator.

# Usage

```
cut_v(inpt_v, sep_ = "")
```

## **Arguments**

```
inpt_v is the input vector
sep_ is the separator of the elements in inpt_v, defaults to ""
```

12 data\_meshup

data\_meshup

data\_meshup

#### **Description**

Allow to automatically arrange 1 dimensional data according to vector and parameters

#### Usage

```
data_meshup(
  data,
  cols = NA,
  file_ = NA,
  sep_ = ";",
  organisation = c(2, 1, 0),
  unic_sep1 = "_",
  unic_sep2 = "-"
)
```

#### **Arguments**

```
data
                     is the data provided (vector) each column is separated by a unic separator and
                     each dataset from the same column is separated by another unic separator (ex:
                     \mathbf{c}("",\,c("d",\,"\text{--"},\,"e",\,"\text{--"},\,"f"),\,\,"",\,\mathbf{c}("\mathbf{a}",\,"\mathbf{a}1",\,"\text{--"},\,"\mathbf{b}",\,"\text{--"},\,"\mathbf{c}",\,"\mathbf{c}1"),\,"\_")
                     are the colnames of the data generated in a csv
cols
                     is the file to which the data will be outputed, defaults to NA which means that
file
                     the functio will return the dataframe generated and won't write it to a csv file
                     is the separator of the csv outputed
sep_
organisation is the way variables include themselves, for instance ,resuming precedent ex-
                     ample, if organisation=c(1, 0) so the data output will be: d, a d, a1 e, c f, c f,
                     is the unic separator between variables (default is "_")
unic_sep1
                     is the unic separator between datasets (default is "-")
unic_sep2
```

#### **Examples**

#6 f c #7 f c1

elements\_equalifier 13

```
elements_equalifier

elements_equalifier
```

#### **Description**

Takes an input vector with elements that have different occurence, and output a vector with all these elements with the same number of occurence, see examples

#### Usage

```
elements_equalifier(inpt_v, untl = 3)
```

#### **Arguments**

```
inpt_v is the input vector
unt1 is how many times each elements will be in the output vector
```

#### **Examples**

```
print(elements_equalifier(letters, unt1 = 2))

[1] "a" "b" "c" "d" "e" "f" "g" "h" "i" "j" "k" "l" "m" "n" "o" "p" "q" "r" "s"
[20] "t" "u" "v" "w" "x" "y" "z" "a" "b" "c" "d" "e" "f" "g" "h" "i" "j" "k" "l"
[39] "m" "n" "o" "p" "q" "r" "s" "t" "u" "v" "w" "x" "y" "z"

print(elements_equalifier(c(letters, letters[-1]), unt1 = 2))

[1] "a" "b" "c" "d" "e" "f" "g" "h" "i" "j" "k" "l" "m" "n" "o" "p" "q" "r" "s"
[20] "t" "u" "v" "w" "x" "y" "z" "b" "c" "d" "e" "f" "g" "h" "i" "j" "k" "l" "m"
[39] "n" "o" "p" "q" "r" "s" "t" "u" "v" "w" "x" "y" "z" "a"
```

```
equalizer_v equalizer_v
```

#### **Description**

Takes a vector of character as an input and returns a vector with the elements at the same size. The size can be chosen via depth parameter.

#### Usage

```
equalizer_v(inpt_v, depth = "max", default_val = "?")
```

# **Arguments**

inpt_v	is the input vector containing all the characters
depth	is the depth parameter, defaults to "max" which means that it is equal to the character number of the element(s) in $inpt_v$ that has the most
default_val	is the default value that will be added to the output characters if those has an inferior length (characters) than the value of depth

14 fillr

#### **Examples**

```
print(equalizer_v(inpt_v=c("aa", "zzz", "q"), depth=2))
#[1] "aa" "zz" "q?"
print(equalizer_v(inpt_v=c("aa", "zzz", "q"), depth=12))
#[1] "aa?????????" "zzz???????" "q?????????"
```

```
extrt_only_v
```

extrt\_only\_v

#### **Description**

Returns the elements from a vector "inpt\_v" that are in another vector "pttrn\_v"

# Usage

```
extrt_only_v(inpt_v, pttrn_v)
```

#### **Arguments**

inpt\_v is the input vector

pttrn\_v is the vector contining all the elements that can be in inpt\_v

# **Examples**

```
print(extrt_only_v(inpt_v=c("oui", "non", "peut", "oo", "ll", "oui", "non", "oui", "oui")
    pttrn_v=c("oui")))
#[1] "oui" "oui" "oui" "oui"
```

fillr

fillr

#### **Description**

Allow to fill a vector by the last element n times

#### Usage

```
fillr(inpt_v, ptrn_fill = "\\.\\.\\d")
```

#### **Arguments**

inpt\_v is the input vector

 $\verb|ptrn_fill| is the pattern used to detect where the function has to fill the vector by the last$ 

element n times. It defaults to "...\d" where "\d" is the regex for an int value. So

this paramater has to have "\d" which designates n.

fixer\_nest\_v 15

#### **Examples**

```
print(fillr(c("a", "b", "...3", "c")))
#[1] "a" "b" "b" "b" "c"
```

```
fixer_nest_v
```

fixer\_nest\_v

#### **Description**

Retur the elements of a vector "wrk\_v" (1) that corresponds to the pattern of elements in another vector "cur\_v" (2) according to another vector "pttrn\_v" (3) that contains the patter elements.

# Usage

```
fixer_nest_v(cur_v, pttrn_v, wrk_v)
```

#### **Arguments**

cur\_v is the input vector

pttrn\_v is the vector containing all the patterns that may be contained in cur\_v

wrk\_v is a vector containing all the indexes of cur\_v taken in count in the function

#### **Examples**

id\_keepr

id\_keepr\_datf

# Description

Allow to get the original indexes after multiple equality comparaison according to the original number of row

#### Usage

```
id_keepr(inpt_datf, col_v = c(), el_v = c(), rstr_l = NA)
```

incr\_fillr

#### **Arguments**

inpt_datf	is the input dataframe
col_v	is the vector containing the column numbers or names to be compared to their respective elements in "el_v" $$
el_v	is a vector containing the elements that may be contained in their respective column described in "col_v" $$
rstr_l	is a list containing the vector composed of the indexes of the elements chosen for each comparison. If the length of the list is inferior to the length of comparisons, so the last vector of rstr_l will be the same as the last one to fill make rstr_l equal in term of length to col_v and el_v

#### **Examples**

incr\_fillr incr\_fillr

#### **Description**

Take a vector uniquely composed by double and sorted ascendingly, a step, another vector of elements whose length is equal to the length of the first vector, and a default value. If an element of the vector is not equal to its predecessor minus a user defined step, so these can be the output according to the parameters (see example):

# Usage

```
incr_fillr(inpt_v, wrk_v = NA, default_val = NA, step = 1)
```

inter\_max 17

#### **Arguments**

inpt\_v is the asending double only composed vector
wrk\_v is the other vector (size equal to inpt\_v), defaults to NA
default\_val is the default value put when the difference between two following elements of inpt\_v is greater than step, defaults to NA
step is the allowed difference between two elements of inpt\_v

#### **Examples**

inter\_max inter\_max

# Description

Takes as input a list of vectors composed of ints or floats ascendly ordered (intervals) that can have a different step to one of another element ex: list(c(0, 2, 4), c(0, 4), c(1, 2, 2.3)). The function will return the list of lists altered according to the maximum step found in the input list.

# Usage

```
inter_max(inpt_l, max_ = -1000, get_lst = TRUE)
```

# Arguments

inpt\_l is the input list
max\_ is a value you are sure is the minimum step value of all the sub-lists
get\_lst is the parameter that, if set to True, will keep the last values of vectors in the return value if the last step exceeds the end value of the vector.

18 inter\_min

#### **Examples**

```
print(inter_max(inpt_l=list(c(0, 2, 4), c(0, 4), c(1, 2, 2.3)), get_lst=TRUE))
#[[1]]
#[1] 0 4
#
#[[2]]
#[1] 0 4
#
#[[3]]
#[1] 1.0 2.3

print(inter_max(inpt_l=list(c(0, 2, 4), c(0, 4), c(1, 2, 2.3)), get_lst=FALSE))
# [[1]]
# [[1] 0 4
# # # [[2]]
# [1] 0 4
# # # [[3]]
# [1] 1
```

inter\_min

inter\_min

# Description

Takes as input a list of vectors composed of ints or floats ascendly ordered (intervals) that can have a different step to one of another element ex: list(c(0, 2, 4), c(0, 4), c(1, 2, 2.3)). This function will return the list of vectors with the same steps preserving the begin and end value of each interval. The way the algorythmn searches the common step of all the sub-lists is also given by the user as a parameter, see how\_to paramaters.

# Usage

```
inter_min(
  inpt_l,
  min_ = 1000,
  sensi = 3,
  sensi2 = 3,
  how_to_op = c("divide"),
  how_to_val = c(3)
)
```

### **Arguments**

is the input list containing all the intervals

min\_ is a value you are sure is superior to the maximum step value in all the intervals

sensi is the decimal accuracy of how the difference between each value n to n+1 in an interval is calculated

lst\_flatnr 19

sensi2	is the decimal accuracy of how the value with the common step is calculated in all the intervals
how_to_op	is a vector containing the operations to perform to the pre-common step value, defaults to only "divide". The operations can be "divide", "substract", "multiply" or "add". All type of operations can be in this parameter.
how_to_val	is a vector containing the value relatives to the operations in $hot\_to\_op$ , defaults to 3 output from ex:

#### **Examples**

```
print(inter_min(inpt_l=list(c(0, 2, 4), c(0, 4), c(1, 2, 2.3))))
# [[1]]
# [1] 0.0 0.1 0.2 0.3 0.4 0.5 0.6 0.7 0.8 0.9 1.0 1.1 1.2 1.3 1.4 1.5 1.6 1.7 1.8
#[20] 1.9 2.0 2.1 2.2 2.3 2.4 2.5 2.6 2.7 2.8 2.9 3.0 3.1 3.2 3.3 3.4 3.5 3.6 3.7
#[39] 3.8 3.9 4.0
#
#[[2]]
# [1] 0.0 0.1 0.2 0.3 0.4 0.5 0.6 0.7 0.8 0.9 1.0 1.1 1.2 1.3 1.4 1.5 1.6 1.7 1.8
#[20] 1.9 2.0 2.1 2.2 2.3 2.4 2.5 2.6 2.7 2.8 2.9 3.0 3.1 3.2 3.3 3.4 3.5 3.6 3.7

# [1] 1.0 1.1 1.2 1.3 1.4 1.5 1.6 1.7 1.8 1.9 2.0 2.1 2.2 2.3
```

lst\_flatnr

lst\_flatnr

# Description

Flatten a list to a vector

#### Usage

```
lst_flatnr(inpt_l)
```

#### **Arguments**

```
inpt_l is the input list
```

```
print(lst_flatnr(inpt_l=list(c(1, 2), c(5, 3), c(7, 2, 7))))
#[1] 1 2 5 3 7 2 7
```

20 multitud

match\_by

*match\_by* 

#### **Description**

Allow to match elements by ids, see examples.

#### Usage

```
match_by(to_match_v = c(), inpt_v = c(), inpt_ids = c())
```

#### **Arguments**

inpt\_v is the vector containing all the elements to match
inpt\_v is the input vector containing all the elements that could contains the elements
to match. Each elements is linked to an element from inpt\_ids at any given
index, see examples. So inpt\_v and inpt\_ids must be the same size
inpt\_ids is the vector containing all the ids for the elements in inpt\_v. An element is
linked to the id x is both are at the same index. So inpt\_v and inpt\_ids must be
the same size

#### **Examples**

multitud

multitud

# Description

```
From a list containing vectors allow to generate a vector following this rule: list(c("a", "b"), c("1", "2"), c("A", "Z", "E")) -> c("a1A", "b1A", "a2A", "b2A", a1Z, ...)
```

#### Usage

```
multitud(l, sep_ = "")
```

nb2\_follow 21

#### **Arguments**

```
is the list

sep_ is the separator between elements (default is set to "" as you see in the example)
```

#### **Examples**

```
print(multitud(l=list(c("a", "b"), c("1", "2"), c("A", "Z", "E"), c("Q", "F")), sep_="/")
#[1] "a/1/A/Q" "b/1/A/Q" "a/2/A/Q" "b/2/A/Q" "a/1/Z/Q" "b/1/Z/Q" "a/2/Z/Q"
#[8] "b/2/Z/Q" "a/1/E/Q" "b/1/E/Q" "a/2/E/Q" "b/2/E/Q" "a/1/A/F" "b/1/A/F"
#[15] "a/2/A/F" "b/2/A/F" "a/1/Z/F" "b/1/Z/F" "a/2/Z/F" "b/2/Z/F" "a/1/E/F"
#[22] "b/1/E/F" "a/2/E/F" "b/2/E/F"
```

nb2\_follow

nb2\_follow

#### **Description**

Allows to get the number and pattern of potential continuous pattern after an index of a vector, see examples

#### Usage

```
nb2_follow(inpt_v, inpt_idx, inpt_follow_v = c())
```

# Arguments

```
inpt_v is the input vector
inpt_idx is the index
inpt_follow_v
```

is a vector containing the patterns that are potentially just after inpt\_nb

```
print(nb2_follow(inpt_v = c(1:12), inpt_idx = 4, inpt_follow_v = c(5)))

[1] 1 5
# we have 1 times the pattern 5 just after the 4nth index of inpt_v

print(nb2_follow(inpt_v = c(1, "non", "oui", "oui", "oui", "nop", 5), inpt_idx = 2, inpt_
[1] "3" "oui"

# we have 3 times continuously the pattern 'oui' and 0 times the pattern 5 just after the print(nb2_follow(inpt_v = c(1, "non", "5", "5", "5", "nop", 5), inpt_idx = 2, inpt_follow
[1] "3" "5"
```

nest\_v

# Description

Allow to get the number of certains patterns that may be after an index of a vector continuously, see examples

# Usage

```
nb_follow(inpt_v, inpt_idx, inpt_follow_v = c())
```

# **Arguments**

```
inpt_v is the input vector
inpt_idx is the index
inpt_follow_v
```

is a vector containing all the potential patterns that may follow the element in the vector at the index inpt\_idx

#### **Examples**

```
nest_v nest_v
```

#### **Description**

Nest two vectors according to the following parameters.

# Usage

```
nest_v(f_v, t_v, step = 1, after = 1)
```

# Arguments

f_v	is the vector that will welcome the nested vector t_v
t_v	is the imbriquator vector
step	defines after how many elements of $f_v$ the next element of $t_v$ can be put in the output
after	defines after how many elements of f_v, the begining of t_v can be put

new\_ordered 23

#### **Examples**

new\_ordered

new\_ordered

#### **Description**

Returns the indexes of elements contained in "w\_v" according to "f\_v"

# Usage

```
new_ordered(f_v, w_v, nvr_here = NA)
```

# **Arguments**

f\_v is the input vector

w\_v is the vector containing the elements that can be in f\_v

nvr\_here is a value you are sure is not present in f\_v

# **Examples**

```
print(new_ordered(f_v=c("non", "non", "non", "oui"), w_v=c("oui", "non", "non")))
#[1] 4 1 2
```

occu

осси

#### **Description**

Allow to see the occurence of each variable in a vector. Returns a datafame with, as the first column, the all the unique variable of the vector and , in he second column, their occurence respectively.

#### Usage

```
occu(inpt_v)
```

### **Arguments**

inpt\_v

the input dataframe

24 pattern\_gettr

#### **Examples**

# Description

Allow to convert index of elements in a vector inpt\_v to index of an vector type 1:sum(nchar(inpt\_v)), see examples

### Usage

```
old_to_new_idx(inpt_v = c())
```

# **Arguments**

```
inpt_v is the input vector
```

#### **Examples**

```
print(old_to_new_idx(inpt_v = c("oui", "no", "eeee")))
[1] 1 1 1 2 2 3 3 3 3
```

```
pattern_gettr pattern_gettr
```

#### **Description**

Search for pattern(s) contained in a vector in another vector and return a list containing matched one (first index) and their position (second index) according to these rules: First case: Search for patterns strictly, it means that the searched pattern(s) will be matched only if the patterns contained in the vector that is beeing explored by the function are present like this c("pattern\_searched", "other", ..., "pattern\_searched") and not as c("other\_thing pattern\_searched other\_thing", "other", ..., "pattern\_searched other\_thing") Second case: It is the opposite to the first case, it means that if the pattern is partially present like in the first position and the last, it will be considered like a matched pattern. REGEX can also be used as pattern

pattern\_tuning 25

#### Usage

```
pattern_gettr(
  word_,
  vct,
  occ = c(1),
  strict,
  btwn,
  all_in_word = "yes",
  notatall = "###"
)
```

# **Arguments**

word_	is the vector containing the patterns
vct	is the vector being searched for patterns
occ	a vector containing the occurence of the pattern in word_ to be matched in the vector being searched, if the occurence is 2 for the nth pattern in word_ and only one occurence is found in vct so no pattern will be matched, put "forever" to no longer depend on the occurence for the associated pattern
strict	a vector containing the "strict" condition for each nth vector in word_ ("strict" is the string to activate this option)
btwn	is a vector containing the condition ("yes" to activate this option) meaning that if "yes", all elements between two matched patern in vct will be returned , so the patterns you enter in word_ have to be in the order you think it will appear in vct
all_in_word	is a value (default set to "yes", "no" to activate this option) that, if activated, won't authorized a previous matched pattern to be matched again
notatall	is a string that you are sure is not present in vct

# **Examples**

```
print(pattern_gettr(word_=c("oui", "non", "erer"), vct=c("oui", "oui", "non", "oui",
    "non", "opp", "opp", "erer", "non", "ok"), occ=c(1, 2, 1),
    btwn=c("no", "yes", "no"), strict=c("no", "no", "ee")))

#[[1]]
#[1] 1 5 8
#
#[[2]]
#[1] "oui" "non" "opp" "opp" "erer"
```

```
pattern_tuning pattern_tuning
```

### **Description**

Allow to tune a pattern very precisely and output a vector containing its variations n times.

26 pre\_to\_post\_idx

#### Usage

```
pattern_tuning(
  pattrn,
  spe_nb,
  spe_l,
  exclude_type,
  hmn = 1,
  rg = c(1, nchar(pattrn))
)
```

# Arguments

pattrn is the character that will be tuned

spe\_nb is the number of new character that will be replaced

spe\_1 is the source vector from which the new characters will replace old ones

exclude\_type is character that won't be replaced

hmn is how many output the function will return

rg is a vector with two parameters (index of the first letter that will be replaced,

index of the last letter that will be replaced) default is set to all the letters from

the source pattern

#### **Examples**

```
print(pattern_tuning(pattrn="oui", spe_nb=2, spe_l=c("e", "r", "T", "O"), exclude_type="c" #[1] "orT" "oTr" "oOi"
```

#### **Description**

Allow to convert indexes from a pre-vector to post-indexes based on a current vector, see examples

# Usage

```
pre_to_post_idx(inpt_v = c(), inpt_idx = c(1:length(inppt_v)))
```

#### **Arguments**

```
inpt_v is the new vector
```

inpt\_idx is the vector containing the pre-indexes

```
print(pre_to_post_idx(inpt_v = c("oui", "no", "eee"), inpt_idx = c(1:8)))
[1] 1 1 1 2 2 3 3 3
As if the first vector was c("o", "u", "i", "n", "o", "e", "e", "e")
```

ptrn\_switchr 27

ptrn_switchr	ptrn_switchr	
--------------	--------------	--

#### **Description**

Allow to switch, copy pattern for each element in a vector. Here a pattern is the values that are separated by a same separator. Example: "xx-xxx-xx" or "xx/xx/xxxx". The xx like values can be switched or copied from whatever index to whatever index. Here, the index is like this 1-2-3 etcetera, it is relative of the separator.

#### Usage

```
ptrn_switchr(inpt_l, f_idx_l = c(), t_idx_l = c(), sep = "-", default_val = NA)
```

#### **Arguments**

inpt_l	is the input vector
f_idx_l	is a vector containing the indexes of the pattern you want to be altered.
t_idx_l	is a vector containing the indexes to which the indexes in f_idx_l are related.
sep	is the separator, defaults to "-"
default_val	is the default value , if not set to NA, of the pattern at the indexes in $f_idx_l$ . If it is not set to NA, you do not need to fill $t_idx_l$ because this is the vector containing the indexes of the patterns that will be set as new values relatively to the indexes in $f_idx_l$ . Defaults to NA.

#### **Examples**

```
print(ptrn_switchr(inpt_l=c("2022-01-11", "2022-01-14", "2022-01-21",
   "2022-01-01"), f_idx_l=c(1, 2, 3), t_idx_l=c(3, 2, 1)))
#[1] "11-01-2022" "14-01-2022" "21-01-2022" "01-01-2022"

print(ptrn_switchr(inpt_l=c("2022-01-11", "2022-01-14", "2022-01-21",
   "2022-01-01"), f_idx_l=c(1), default_val="ee"))
#[1] "ee-01-11" "ee-01-14" "ee-01-21" "ee-01-01"
```

```
ptrn_twkr ptrn_twkr
```

# Description

Allow to modify the pattern length of element in a vector according to arguments. What is here defined as a pattern is something like this xx-xx-xx or xx/xx/xxx... So it is defined by the separator

28 rearangr\_v

#### Usage

```
ptrn_twkr(
   inpt_l,
   depth = "max",
   sep = "-",
   default_val = "0",
   add_sep = TRUE,
   end_ = TRUE
)
```

#### Arguments

inpt\_l is the input vector depth is the number (numeric) of separator it will keep as a result. To keep the number of separator of the element that has the minimum amount of separator do depth="min" and depth="max" (character) for the opposite. This value defaults to "max". is the separator of the pattern, defaults to "-" sep is the default val that will be placed between the separator, defaults to "00" default val add\_sep defaults to TRUE. If set to FALSE, it will remove the separator for the patterns that are included in the interval between the depth amount of separator and the actual number of separator of the element. is if the default\_val will be added at the end or at the beginning of each element end that lacks length compared to depth

# **Examples**

```
v <- c("2012-06-22", "2012-06-23", "2022-09-12", "2022")
ptrn_twkr(inpt_l=v, depth="max", sep="-", default_val="00", add_sep=TRUE)
#[1] "2012-06-22" "2012-06-23" "2022-09-12" "2022-00-00"
ptrn_twkr(inpt_l=v, depth=1, sep="-", default_val="00", add_sep=TRUE)
#[1] "2012-06" "2012-06" "2022-09" "2022-00"
ptrn_twkr(inpt_l=v, depth="max", sep="-", default_val="00", add_sep=TRUE, end_=FALSE)
#[1] "2012-06-22" "2012-06-23" "2022-09-12" "00-00-2022"</pre>
```

rearangr\_v

rearangr\_v

# Description

Reanranges a vector "w\_v" according to another vector "inpt\_v". inpt\_v contains a sequence of number. inpt\_v and w\_v have the same size and their indexes are related. The output will be a vector containing all the elements of w\_v rearanges in descending or asending order according to inpt\_v

regroupr 29

#### Usage

```
rearangr_v(inpt_v, w_v, how = "increasing")
```

#### **Arguments**

inpt\_v is the vector that contains the sequence of number
 w\_v is the vector containing the elements related to inpt\_v
 how is the way the elements of w\_v will be outputed according to if inpt\_v will be sorted ascendigly or descendingly

# **Examples**

```
print(rearangr_v(inpt_v=c(23, 21, 56), w_v=c("oui", "peut", "non"), how="decreasing"))
#[1] "non" "oui" "peut"
```

regroupr

regroupr

# Description

Allow to sort data like "c(X1/Y1/Z1, X2/Y1/Z2, ...)" to what you want. For example it can be to "c(X1/Y1/Z1, X1/Y1/Z2, ...)"

# Usage

```
regroupr(
  inpt_v,
  sep_ = "-",
  order = c(1:length(unlist(strsplit(x = inpt_v[1], split = sep_)))),
  l_order = NA
)
```

#### **Arguments**

inpt_v	is the input vector containing all the data you want to sort in a specific way. All the sub-elements should be separated by a unique separator such as "-" or "/"
sep_	is the unique separator separating the sub-elements in each elements of inpt_v
order	is a vector describing the way the elements should be sorted. For example if you want this dataset " $c(X1/Y1/Z1, X2/Y1/Z2,)$ " to be sorted by the last element you should have order= $c(3:1)$ , for example, and it should returns something like this $c(X1/Y1/Z1, X2/Y1/Z1, X1/Y2/Z1,)$ assuming you have only two values for X.
l_order	is a list containing the vectors of values you want to order first for each sub- elements

30 r\_print

#### **Examples**

```
vec <- multitud(l=list(c("a", "b"), c("1", "2"), c("A", "Z", "E"), c("Q", "F")), sep_="/"</pre>
print (vec)
# [1] "a/1/A/Q" "b/1/A/Q" "a/2/A/Q" "b/2/A/Q" "a/1/Z/Q" "b/1/Z/Q" "a/2/Z/Q"
# [8] "b/2/Z/Q" "a/1/E/Q" "b/1/E/Q" "a/2/E/Q" "b/2/E/Q" "a/1/A/F" "b/1/A/F"
#[15] "a/2/A/F" "b/2/A/F" "a/1/Z/F" "b/1/Z/F" "a/2/Z/F" "b/2/Z/F" "a/1/E/F"
#[22] "b/1/E/F" "a/2/E/F" "b/2/E/F"
print(regroupr(inpt_v=vec, sep_="/"))
# [1] "a/1/1/1"
                "a/1/2/2"
                                        "a/1/4/4"
                                                   "a/1/5/5"
                                                               "a/1/6/6"
                            "a/1/3/3"
# [7] "a/2/7/7" "a/2/8/8" "a/2/9/9" "a/2/10/10" "a/2/11/11" "a/2/12/12"
#[13] "b/1/13/13" "b/1/14/14" "b/1/15/15" "b/1/16/16" "b/1/17/17" "b/1/18/18"
#[19] "b/2/19/19" "b/2/20/20" "b/2/21/21" "b/2/22/22" "b/2/23/23" "b/2/24/24"
vec <- vec[-2]
print(regroupr(inpt_v=vec, sep_="/"))
                                       "a/1/4/4" "a/1/5/5" "a/1/6/6"
# [1] "a/1/1/1"
                "a/1/2/2"
                           "a/1/3/3"
                           # [7] "a/2/7/7"
                "a/2/8/8"
#[13] "b/1/13/13" "b/1/14/14" "b/1/15/15" "b/1/16/16" "b/1/17/17" "b/2/18/18"
#[19] "b/2/19/19" "b/2/20/20" "b/2/21/21" "b/2/22/22" "b/2/23/23"
print(regroupr(inpt_v=vec, sep_="/", order=c(4:1)))
#[1] "1/1/A/Q"
                "2/2/A/Q"
                           "3/3/A/Q"
                                       "4/4/A/Q"
                                                 "5/5/Z/Q"
                                                            "6/6/Z/Q"
# [7] "7/7/Z/Q" "8/8/Z/Q" "9/9/E/Q" "10/10/E/Q" "11/11/E/Q" "12/12/E/Q"
#[13] "13/13/A/F" "14/14/A/F" "15/15/A/F" "16/16/A/F" "17/17/Z/F" "18/18/Z/F"
#[19] "19/19/Z/F" "20/20/Z/F" "21/21/E/F" "22/22/E/F" "23/23/E/F" "24/24/E/F"
```

 $r_print$   $r_print$ 

### Description

Allow to print vector elements in one row.

#### Usage

```
r_print(inpt_v, sep_ = "and", begn = "This is", end = ", voila!")
```

#### Arguments

inpt_v	is the input vector
sep_	is the separator between each elements
begn	is the character put at the beginning of the print
end	is the character put at the end of the print

save\_untl 31

# **Examples**

```
print(r_print(inpt_v=c(1:33)))  
#[1] "This is 1 and 2 and 3 and 4 and 5 and 6 and 7 and 8 and 9 and 10 and 11 and 12 and \frac{1}{2} and 14 and 15 and 16 and 17 and 18 and 19 and 20 and 21 and 22 and 23 and 24 and 25 and \frac{1}{2} and 28 and 29 and 30 and 31 and 32 and 33 and , voila!"
```

save\_untl

save\_untl

# Description

Get the elements in each vector from a list that are located before certain values

### Usage

```
save_untl(inpt_l = list(), val_to_stop_v = c())
```

#### **Arguments**

```
\begin{array}{ll} \text{inpt\_l} & \text{is the input list containing all the vectors} \\ \text{val\_to\_stop\_v} \end{array}
```

is a vector containing the values that marks the end of the vectors returned in the returned list, see the examples

```
print(save_untl(inpt_l=list(c(1:4), c(1, 1, 3, 4), c(1, 2, 4, 3)), val_to_stop_v=c(3, 4))
#[[1]]
#[1] 1 2
#
#[[2]]
#[1] 1 1
#
#[[3]]
#[1] 1 2
print(save_untl(inpt_l=list(c(1:4), c(1, 1, 3, 4), c(1, 2, 4, 3)), val_to_stop_v=c(3)))
#[[1]]
#[1] 1 2
#
#[[2]]
#[1] 1 2
#
#[[3]]
#[1] 1 2 4
```

see\_idx

see_diff	see_diff		
----------	----------	--	--

# Description

Output the opposite of intersect(a, b). Already seen at: https://stackoverflow.com/questions/19797954/function-to-find-symmetric-difference-opposite-of-intersection-in-r

# Usage

```
see\_diff(vec1 = c(), vec2 = c())
```

# **Arguments**

```
vec1 is the first vector
vec2 is the second vector
```

# Examples

```
print(see_diff(c(1:7), c(4:12)))
[1] 1 2 3 8 9 10 11 12
```

# **Description**

Returns a boolean vector to see if a set of elements contained in v1 is also contained in another vector (v2)

# Usage

```
see_idx(v1, v2)
```

#### **Arguments**

```
v1 is the first vector
v2 is the second vector
```

```
print(see_idx(v1=c("oui", "non", "peut", "oo"), v2=c("oui", "peut", "oui")))
#[1] TRUE FALSE TRUE FALSE
```

see\_mode 33

see\_mode see\_mode

#### **Description**

Allow to get the mode of a vector, see examples.

#### Usage

```
see\_mode(inpt\_v = c())
```

#### **Arguments**

inpt\_v is the input vector

### **Examples**

```
print(see_mode(inpt_v = c(1, 1, 2, 2, 2, 3, 1, 2)))
[1] 2
print(see_mode(inpt_v = c(1, 1, 2, 2, 2, 3, 1)))
[1] 1
```

```
str_remove_untl str_remove_untl
```

#### **Description**

Allow to remove pattern within elements from a vector precisely according to their occurence.

#### Usage

```
str_remove_untl(
  inpt_v,
  ptrn_rm_v = c(),
  untl = list(c(1)),
  nvr_following_ptrn = "NA"
)
```

# Arguments

```
inpt_v is the input vector
ptrn_rm_v is a vector containing the patterns to remove
untl is a list containing the occurence(s) of each pattern to remove in the elements.
nvr_following_ptrn
```

is a sequel of characters that you are sure is not present in any of the elements in inpt\_v

34 test\_order

#### **Examples**

```
vec <- c("45/56-/98mm", "45/56-/98mm", "45/56-/98-mm//")
print(str_remove_untl(inpt_v=vec, ptrn_rm_v=c("-", "/"), untl=list(c("max"), c(1))))
#[1] "4556/98mm" "4556/98mm" "4556/98mm//"
print(str_remove_untl(inpt_v=vec, ptrn_rm_v=c("-", "/"), untl=list(c("max"), c(1:2))))
#[1] "455698mm" "455698mm" "455698mm//"
print(str_remove_untl(inpt_v=vec[1], ptrn_rm_v=c("-", "/"), untl=c("max")))
#[1] "455698mm" "455698mm" "455698mm"</pre>
```

successive\_diff successive\_diff

### **Description**

Allow to see the difference beteen the suxxessive elements of an numeric vector

#### Usage

```
successive_diff(inpt_v)
```

#### **Arguments**

inpt\_v is the input numeric vector

### **Examples**

```
print(successive_diff(c(1:10)))
[1] 1 1 1 1 1
print(successive_diff(c(1:11, 13, 19)))
[1] 1 1 1 1 1 2 6
```

test\_order

same\_order

#### **Description**

Allow to get if two vectors have their commun elements in the same order, see examples

#### Usage

```
test_order(inpt_v_from, inpt_v_test)
```

to\_unique 35

#### **Arguments**

is

the vector we want to test if its commun element with inpt\_v\_from are in the same order

#### **Examples**

```
print(test_order(inpt_v_from = c(1:8), inpt_v_test = c(1, 4)))
[1] TRUE
print(test_order(inpt_v_from = c(1:8), inpt_v_test = c(1, 4, 2)))
[1] FALSE
```

to\_unique

to\_unique

#### **Description**

Allow to transform a vector containing elements that have more than 1 occurrence to a vector with only uniques elements.

#### Usage

```
to_unique(inpt_v, distinct_type = "suffix", distinct_val = "number", sep = "-")
```

# **Arguments**

36 unique\_pos

```
unique_ltr_from_v unique_ltr_from_v
```

# Description

Returns the unique characters contained in all the elements from an input vector "inpt\_v"

#### Usage

```
unique_ltr_from_v(inpt_v, keep_v = c("?", "!", ":", "&", ",", ".", letters))
```

#### **Arguments**

inpt\_v is the input vector containing all the elements

keep\_v is the vector containing all the characters that the elements in inpt\_v may contain

#### **Examples**

```
print(unique_ltr_from_v(inpt_v=c("bonjour", "lpoerc", "nonnour", "bonnour", "nonjour", "a
#[1] "b" "o" "n" "j" "u" "r" "l" "p" "e" "c" "a" "v" "i"
```

unique\_pos

unique\_pos

#### **Description**

Allow to find the first index of the unique values from a vector.

#### Usage

```
unique_pos(vec)
```

#### **Arguments**

vec

is the input vector

unique\_total 37

#### **Examples**

```
print(unique_pos(vec=c(3, 4, 3, 5, 6)))
#[1] 1 2 4 5
```

unique\_total

unique\_total

# **Description**

Returns a vector with the total amount of occurences for each element in the input vector. The occurences of each element follow the same order as the unique function does, see examples

# Usage

```
unique_total(inpt_v = c())
```

#### **Arguments**

inpt\_v

is the input vector containing all the elements

#### **Examples**

```
print (unique_total(inpt_v = c(1:12, 1)))
  [1] 2 1 1 1 1 1 1 1 1 1 1 1

print (unique_total(inpt_v = c(1:12, 1, 11, 11)))
  [1] 2 1 1 1 1 1 1 1 1 1 3 1

vec <- c(1:12, 1, 11, 11)
names(vec) <- c(1:15)
print (unique_total(inpt_v = vec))

1 2 3 4 5 6 7 8 9 10 11 12
2 1 1 1 1 1 1 1 1 3 1</pre>
```

until stnl

until stnl

# Description

Maxes a vector to a chosen length. ex: if i want my vector c(1, 2) to be 5 of length this function will return me: c(1, 2, 1, 2, 1)

#### Usage

```
until_stnl(vec1, goal)
```

38 vector\_replacor

# **Arguments**

vec1	is the input vector
goal	is the length to reach

# **Examples**

```
print(until_stnl(vecl=c(1, 3, 2), goal=56))
# [1] 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2
```

```
vector_replacor
```

# Description

Allow to replace certain values in a vector.

#### Usage

```
vector_replacor(inpt_v = c(), sus_val = c(), rpl_val = c(), grep_ = FALSE)
```

# Arguments

inpt_v	is the input vector
sus_val	is a vector containing all the values that will be replaced
rpl_val	is a vector containing the value of the elements to be replaced (sus_val), so sus_val and rpl_val should be the same size
grep_	is if the elements in sus_val should be equal to the elements to replace in inpt_v or if they just should found in the elements

wide\_to\_narrow\_idx 39

```
wide_to_narrow_idx wide_to_narow_idx
```

#### **Description**

Allow to convert the indices of vector ('from\_v\_ids') which are related to the elements of a vector, to fit the newly established maximum character of the vector, see examples.

#### Usage

```
wide_to_narrow_idx(from_v_val = c(), from_v_ids = c(), val = 1)
```

#### **Arguments**

from\_v\_val is the input vector of elements, or just the total number of characters of the
 elementsq in the vector

from\_v\_ids is the input vector of indices

val is the value - 1 from which the number of character of an element is too high, so
 the indices in 'from\_v\_ids' will be modified

```
print(wide_to_narrow_idx(from_v_val = c("oui", "no", "oui"), from_v_ids = c(4, 6, 9), val
[1] 2 4 5
print(wide_to_narrow_idx(from_v_val = c("oui", "no", "oui"), from_v_ids = c(4, 6, 9), val
[1] 2 2 3
print(wide_to_narrow_idx(from_v_val = c("oui", "no", "oui"), from_v_ids = c(4, 6, 9), val
[1] 4 6 9
```
